Ключевые слова: Acarina, Heterostigmata, Scutacaridae, *Archidispus*, новые виды

ABSTRACT

Two new species of mites of the genus *Archidispus* Karafiat, 1959 are described, *Archidispus belorussicus* sp.n. from Byelorussia and *A. tauricus* sp.n. from Crimea. Both species were found to be phoretic on carabid beetles.

РЕЗЮМЕ

Приводится описание двух новых видов клещей рода *Archidispus* Karafiat, 1959. *Archidispus belorussicus* sp.n. из Белоруссии и *A. tauricus* sp.n. из Крыма. Оба вида были найдены форезировавшими на жужелицах.

Mites of the genus *Archidispus* Karafiat, 1959 are usually associated with different carabid beetles [Karafiat, 1959, Kurosa, 1983, Ebermann, 1991]. Two new species of the genus *Archidispus* associated with carabid beetles (Coleoptera: Carabidae) were found in Crimea and Byelorussia. Descriptions of new species are based on phoretic females only.

The terminology used in the description follows that of Lindquist [1986]. All measurements are given in micrometers (μm) for holotype and paratypes (in parentheses). The type material is deposited in the collections of the Department of Acarology, Schmalhausen Institute of Zoology, Kiev, Ukraine.

***Archidispus belorussicus* sp. n.**

Figs. 1–7.

Foretic female. Length of idiosoma 238 (222–233), maximum width 227 (207–214).

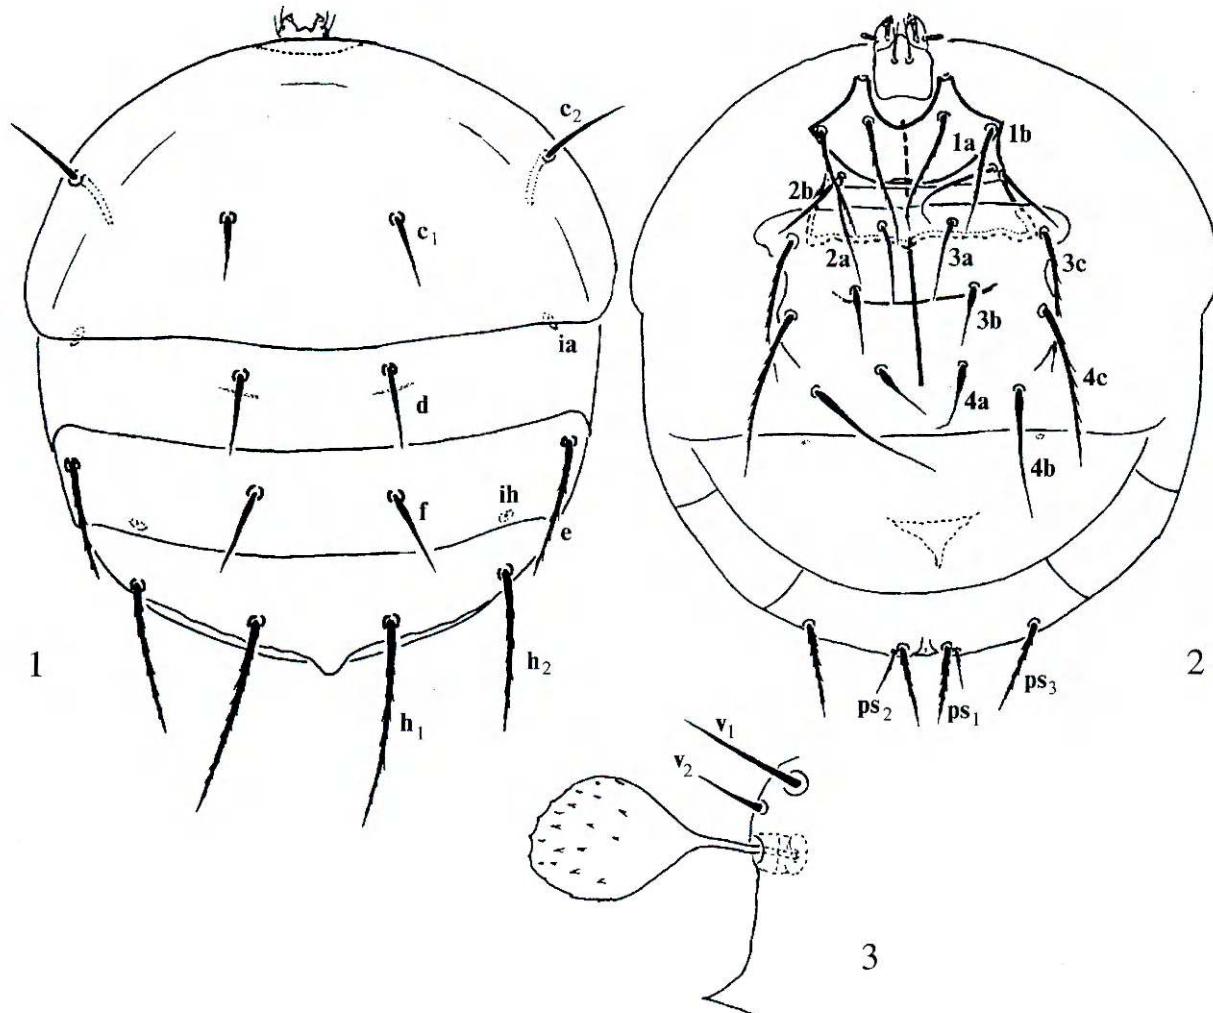

Gnathosoma (Figs. 1–2). Dorsally with 3 pairs of setae, with Gd1>Gd2, both on the same transverse line; pp tiny and hardly visible, inserted anterolaterad to setae Gd2. Ventral surface with 1

pair of setae. Each palp with 2 dorsal setae; ventrally with mushroom-like process and solenidion.

Idiosomal dorsum (Fig. 1). Free margin of tergite C has pronounced stripes. Cupulae ia and ih large, oval. Tergite H with posteromedian tongue-like elongation. Setae c₂ inserted on the free margin of tergite C and have a highly sclerotized alveolar canal. Setae c₁, d, f, h₁ form two longitudinal rows (Fig. 1). Setae c₁, d, f slightly widened at the base. Setae c₁, c₂, d smooth, or weakly barbed at the top half. Setae e, h₁, h₂ distinctly barbed. Lengths of dorsal setae: c₁ 27 (25–27), c₂ 37 (33–37), d 31 (30–33), e 47 (48–50), f 33 (33–34), h₁ 80 (78–81), h₂ 63 (63–66). Distances between dorsal setae: c₁₋₁ 66 (62–65), c₁₋₂ 59 (51–53), d-d 58 (56–61), e-f 75 (66–72), f-f 54 (48–51), h₁₋₁ 54 (49–51), h₁₋₂ 49 (49–50). Propodosomal setae v₁ longer and thicker than v₂. Trichobothrium with thin stem, distally round, with fine barbs (Fig. 3).

Idiosomal venter (Fig. 2). Setae 3b, 4a, 4b with thickened base and smooth. Setae 1a, 1b, 3c, 4c distinctly barbed. Setae ps₁ and ps₃ thickened, barbed. Apodemata IV highly sclerotic, extend to the insertion of setae 3b. Apodemata V completely reduced. Lengths of ventral setae: 1a 52 (48–52), 1b 42 (40–44), 2a 39 (39–50), 2b 31 (29–31), 3a 32 (28–34), 3b 33 (29–32), 3c 50 (50–52), 4a 33 (32–36), 4b 55 (52–57), 4c 67 (69–70), ps₁ 39 (36–39), ps₂ 17 (17–18), ps₃ 49 (47–51).

Legs (Figs. 4–7). Leg I (Fig. 4): setal formulae: Tr 1 – Fe 3 – Ge 4 – TiTa 16 (4) (number of solenidia in parenthesis). Tibiotarsus thickened, with massive claw. Solenidia ω₂ 20 (19–20)>ω₁ 13 (13–14)>φ₂ 12 (11)>φ₁ 11 (10); ω₂ and φ₂ uniformly thin, ω₁ and φ₁ thickened distally. Setae dFe broadened, leaf-like. Leg II (Fig. 5): setal formula: Tr 1 – Fe 3 – Ge 3 – Ti 4 (1) – Ta 6 (1). Tarsus with

Figs. 1–3. *Archidispus belorussicus* sp. n., phoretic female: 1 — dorsum, 2 — venter, 3 — trichobothrium with setae v_1 and v_2 .
Рис. 1–3. *Archidispus belorussicus* sp. n., форезирующая самка: 1 — дорсальная сторона тела, 2 — вентральная сторона тела, 3 — трихоботрий и щетинки v_1 и v_2 .

strongly asymmetrical claws. Solenidion ω 12 (12) broadened at the middle portion, solenidion φ 9 (9) uniformly thin. Leg III (Fig. 6): setal formula: Tr 1 – Fe 2 – Ge 2 – Ti 4 (1) – Ta 6. Claws asymmetrical, but in lesser extent than on tarsus II. Solenidion φ 10 (10) of the same shape as that on leg II. Leg IV (Fig. 7): setal formula: Tr 1 – Fe 2 – Ge 1 – Ti 3 (1) – Ta 6. Tarsus with pretarsus and two small claws, empodium extended, distally widened. Solenidion φ 11 (10–11) of the same shape as on leg II and III.

Male, non-phoretic female and immatures.
Unknown.

DIFFERENTIAL DIAGNOSIS

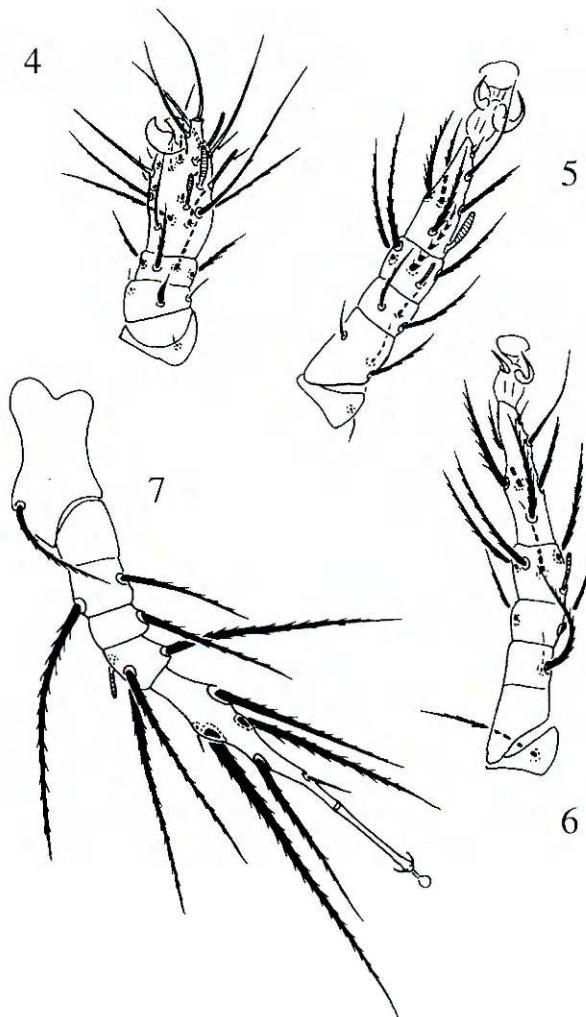

The new species is closely related to *Archidispus tauricus* sp.n. Both species have an unusual position of setae d, which are divided on the same

distance as setae f. Such character is known only in *A. armatus* (Karafiat, 1959). However the new species differs from *A. armatus* by the basally widened setae 3b (simple in *A. armatus*) and 4a (bullet-shaped in *A. armatus*). *Archidispus belorussicus* sp. n. differs from *A. tauricus* sp.n. by shorter setae h1, h2, ps1, ps3 and by less thickened setae 4a and 4b.

Type material. Holotype (female): slide No. 314, Byelorussia, Minsk distr., Stolbtsovskiy reg., settl. Kletischi, on *Pterostichus anthracinus* Ill., 05.06.1984 (collector unknown); paratypes: 7 females with same data as holotype.

ETYMOLOGY

The species is named «*belorussicus*» referring to its geographical distribution.

Figs. 4–7. *Archidispus belorussicus* sp. n., phoretic female: 4–7 — legs I–IV, respectively.

Рис. 4–7. *Archidispus belorussicus* sp. n., фореziрующая самка: 4–7 — ноги I–IV, соответственно.

Archidispus tauricus sp. n.

Figs. 8–15.

Phoretic female. Length of idiosoma 246 (224–259), maximum width 210 (195–224).

Gnathosoma (Figs. 8–9). Dorsally with 3 pairs of setae, with Gd1>Gd2, both on the same transverse line; pp tiny and hardly visible, inserted anterolaterad to setae Gd2. Ventral surface with 1 pair of setae. Each palp with 2 dorsal setae; ventrally with mushroom-like process and solenidion.

Idiosomal dorsum (Fig. 8). Free margin of tergite C has pronounced stripes. Cupulae ia and ih large, oval. Tergite H with posteromedian tongue-like elongation. Setae c₂ inserted on the free margin of tergite C and have a highly sclerotized alveolar canal. Setae c₁, d, f, h₁ form two longitudinal rows (Fig. 8). Setae c₁, d, f slightly widened at their base.

Setae c₁, c₂, d, f weakly barbed at the top half. Setae e, h₁, h, distinctly barbed. Lengths of dorsal setae: c₁ 24 (24–27), c₂ 35 (33–37), d 28 (27–30), e 63 (53–62), f 33 (29–33), h₁ 89 (81–92), h₂ 95 (87–98). Distances between dorsal setae: c_{1–1} 66 (62–66), c_{1–2} 51 (45–54), d–d 52 (52–54), e–f 64 (60–66), f–f 50 (52–53), h_{1–1} 42 (41–43), h_{1–2} 47 (44–50). Trichobothrium with thin stem, distally round, with fine barbs (Fig. 10), setae v₁ longer and thicker than v₂.

Idiosomal venter (Fig. 9). Setae 3b, 4a, 4b with thickened base, smooth. Setae 1a, 1b, 3c, 4c distinctly barbed. Setae ps₁ and ps₃ not thickened, barbed. Apodemata IV highly sclerotic, extended to the insertion of setae 3b. Apodemata V completely reduced. Lengths of ventral setae: 1a 55 (52–55), 1b 38 (39–41), 2a 48 (43–44), 2b 33 (32–36), 3a 33 (28–33), 3b 29 (29–33), 3c 53 (55–62), 4a 33 (28–33), 4b 38 (37–41), 4c 75 (66–77), ps₁ 53 (50–54), ps₂ 20 (19–21), ps₃ 62 (59–65).

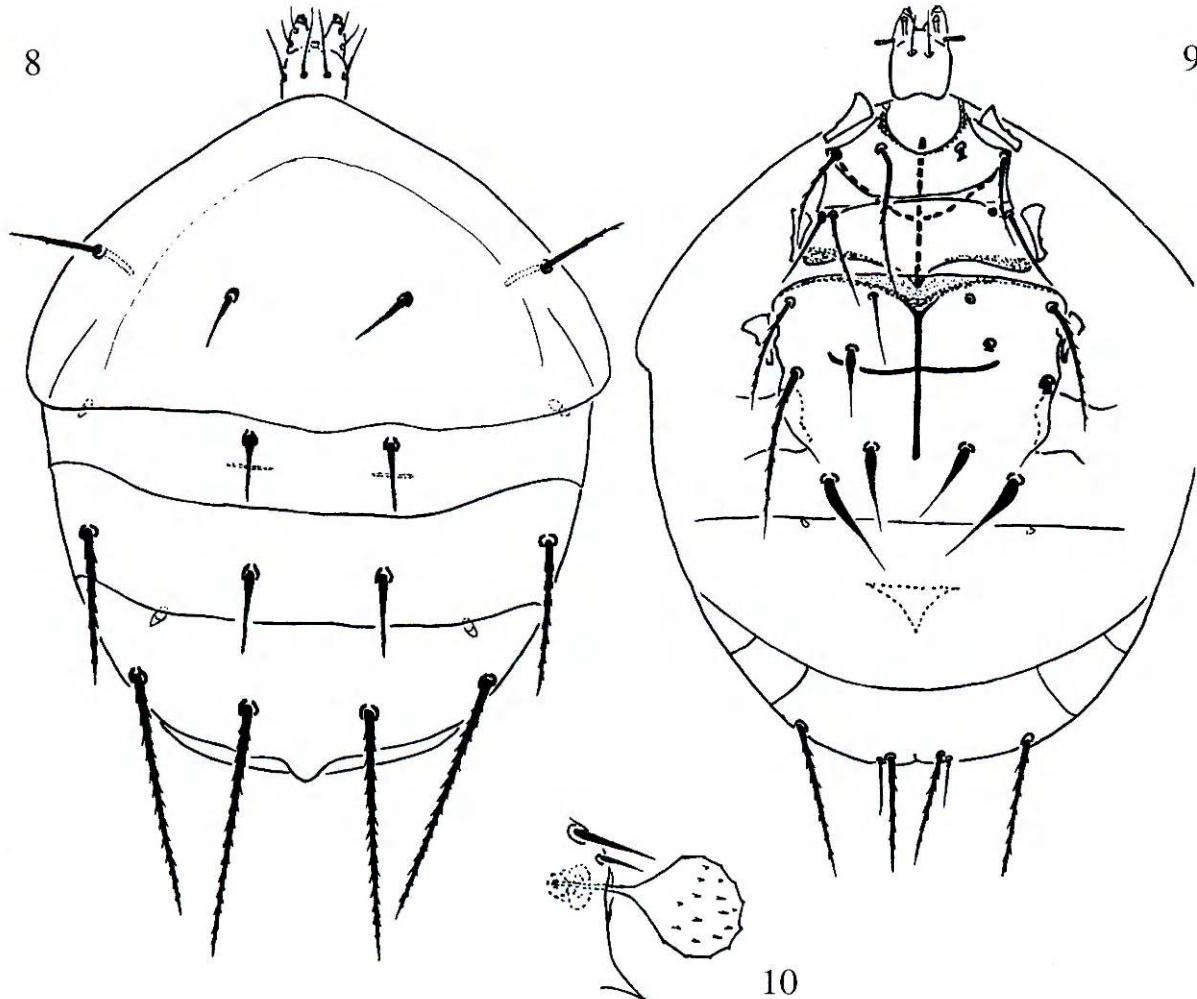

Legs (Figs. 11–15). Leg I (Fig. 11): setal formulae: Tr 1 – Fe 3 – Ge 4 – TiTa 16 (4). Tibiotarsus thickened, with massive claw. Solenidia ω₂ 18 (16–20)>ω₁ 14 (13–14)>φ₁ 11 (10–11)=φ₂ 10 (10–11); ω₂ and φ₂ uniformly thin, ω₁ and φ₁ thickened distally (Fig. 12). Setae dFe broadened, leaf-like. Leg II (Fig. 13): setal formula: Tr 1 – Fe 3 – Ge 3 – Ti4(1)–Ta6(1). Tarsus with strongly asymmetrical claws. Solenidion ω 12 (11–12) broadened at the middle portion, solenidion φ 8 (8–9) broadened distally. Leg III (Fig. 14): setal formula: Tr 1 – Fe 2 – Ge 2 – Ti 4 (1) – Ta 6. Claws asymmetrical, but in lesser extent than on tarsus II. Solenidion φ 8 (8–9) of the same shape as on leg II. Leg IV (Fig. 15): setal formula: Tr 1 – Fe 2 – Ge 1 – Ti 3 (1) – Ta 6. Tarsus with pretarsus and two small claws, empodium extended, distally widened. Solenidion φ 11 (10–11) uniformly thin.

Male, non-phoretic female and immatures. Unknown.

DIFFERENTIAL DIAGNOSIS

As for *A. belorussicus* sp.n.

Type material. Holotype (female): slide No.561, Crimea, Simferopol reg., settl. Perevalnoe, on *Poecilus cupreus* L. (without date), coll. Eidelberg; paratypes; 6 females with same data as holotype; 1 female at the same place as holotype, on *Harpalus distinguendus* Duft. (without date), col. Eidelberg; 3 females at the same place as holotype, on *Amara schaudoiri* Putz., 18.06.1989, coll. Eidelberg; 5 females at the same place as holotype, on *Poecilus cupreus* L., 9.07.1989, coll. Eidelberg; 2

females at the same place as holotype, on *Poecilus punctulatus* Dej., 11.06.1989, coll. Eidelberg; 2 females at the same place as holotype, on *Harpalus affinis* Schrnk., 26.06.1989, coll. Eidelberg; 15 females at the same place as holotype, on *Poecilus cupreus* L., 9.05.1990, coll. Eidelberg.

ETYMOLOGY

The species is named «tauricus» referring to its geographical distribution.

ACKNOWLEDGEMENTS

I thank Dr. Eidelberg, Yalta, Crimea, Ukraine, for sharing his material on scutacarid mites collected on carabid beetles. I also thank Prof. E. Ebermann, Institute of Zoology, Karl-Franzens University, Graz, Austria, for helpful suggestions.
